Abstract:

This report describes MATLAB/Simulink realization of open-circuit and short-circuit tests of transformer without and with saturation that are performed to identify equivalent circuit parameters. The simulation models are developed to support and enhance Advanced Electric Machines graduate course. The proposed test has been successfully integrated into Advanced Electric Machines course based on the reference book: Krause, P.C. andO. Wasynczuk, *Electromechanical Motion Devices*, MacGraw-Hill, 1989/ Chapter 1 section 1.4 & 1.5 (Example 1-C).

Introduction:

In transformers, stationary circuits are magnetically coupled for the purpose of changing the voltage and current levels. Unlike electromechanical devices, circuits in transformers are not in relative motion. Since magnetically couples circuits are necessary in energy conversion, equations which describe their behavior were well established in class as well in book. Taking as example a two winding transformer consist of turns N1 and N2 wounded on a common ferromagnetic core having a large permeability relative to that of the air.

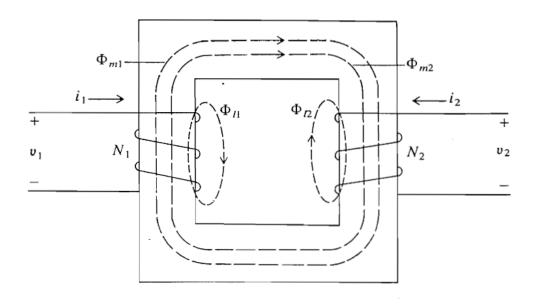

Figure 1: Magnetically coupled circuits

Voltage equations and flux linkage equations described and established in book and class suggest the equivalent T circuit representing the two windings transformer.

$$\begin{bmatrix} v_1 \\ v_2' \end{bmatrix} = \begin{bmatrix} r_1 & 0 \\ 0 & r_2' \end{bmatrix} \begin{bmatrix} i_1 \\ i_2' \end{bmatrix} + \frac{d}{dt} \begin{bmatrix} \lambda_1 \\ \lambda_2' \end{bmatrix} \qquad \qquad \lambda_1 = L_{11}i_1 + L_{m1}i_2'$$

$$\lambda_2' = L_{m1}i_1 + L_{'22}i_2'$$

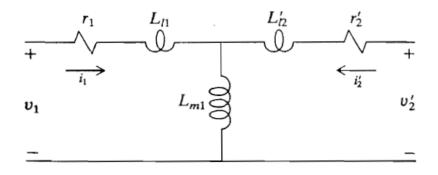

Figure 2: Equivalent T circuit with winding 1 selected as reference

Using the parameters given in example 1C in the book:

 r_1 = 6 Ω , L_{l1} = L'_{l2} = 13.5 mH, L_{m1} = 263.9 mH, X_{m1} = 99.5 Ω , r_2 ' = 5 Ω the transformer was simulated and observed in the open and short circuit characteristics. The variables plotted are λ , v_1 , i_1 , v_2 and i_2 '. Two cases were investigated without and with saturation. When considering the saturation of the transformer we have referred to the magnetizing flux linkage and the magnetizing current. The magnetizing flux linkage λ versus (i_1+i_2) is the plot representing the saturation characteristics of the transformer which has been implemented as well into MATLAB for computer simulation.

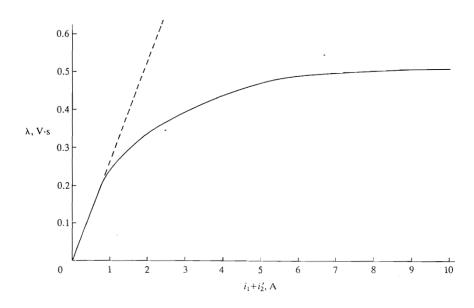

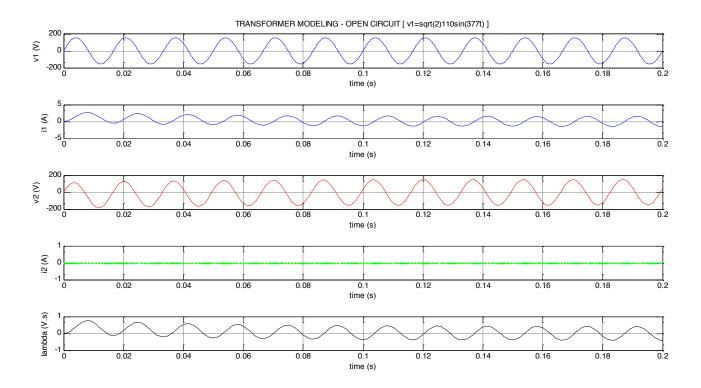

Figure 3: λ versus (i1+i2')

MATLAB simulation code & results:

A- Open circuit v1= $\sqrt{2}$ 110 cos (377t) without saturation:

```

Simulink (SimPowerSystems toolbox) simulation:

A- Open-circuit condition without saturation:

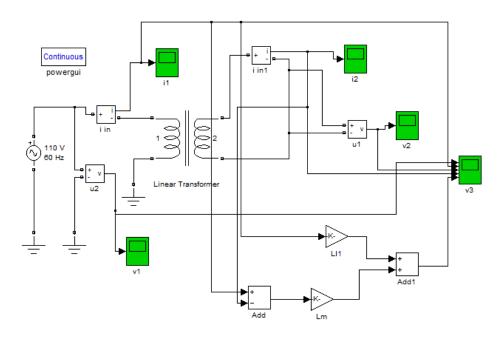

Circuit:

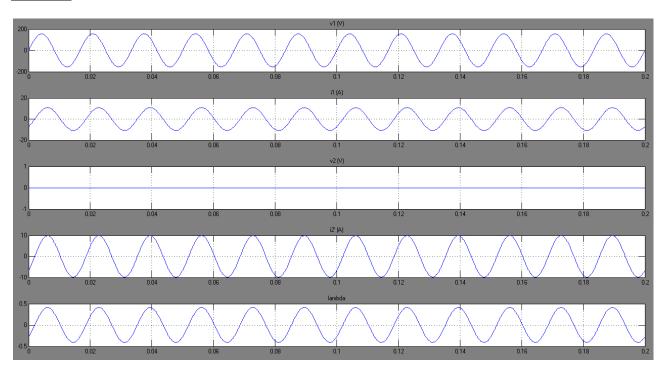

B- Short-circuit condition without saturation:

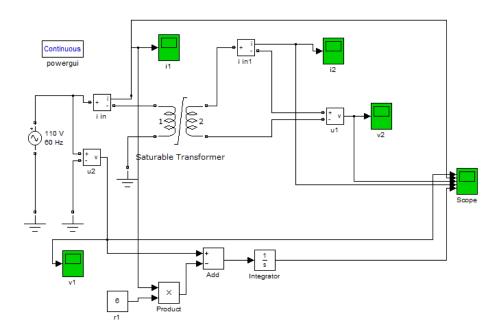

Circuit:

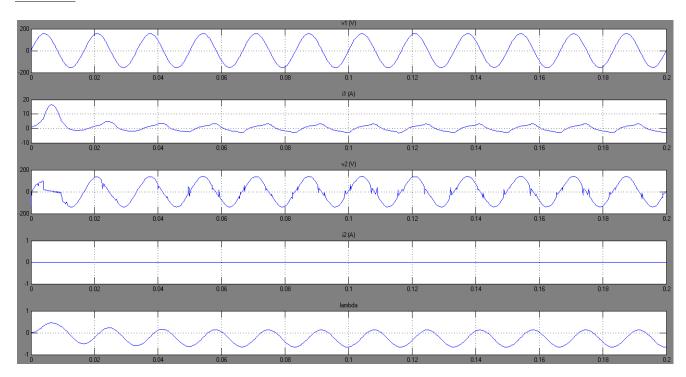

C- Open-circuit condition with saturation:

Circuit:

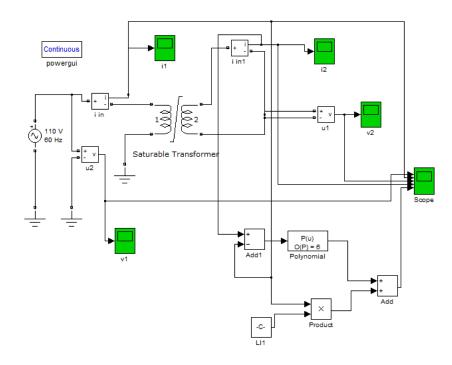

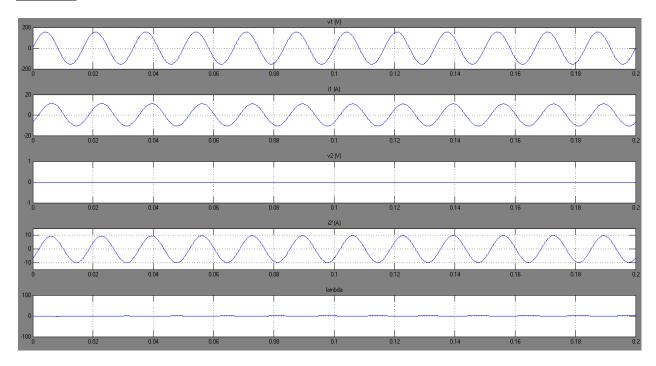

D- Short-circuit condition with saturation:

The following results show that saturation does not occur in short-circuit condition

Circuit:

Conclusion:

The presented simulation models in this report of transformer tests performed to obtain equivalent circuit parameter. Simulation results by MATLAB and Simulink are compared with those obtained in the book (figure 1.5-1, 1.5-2, 1.5-3 & 1.5-5) and they are matched. This task shows that MATLAB with Simulink/SimPowerSystems toolbox is a good simulation tool to model transformer tests and do the evaluation on steady state and transient characteristics (with or without saturation).
